

List of aedine species with published illustrations and/or descriptions of female genitalia (Diptera: Culicidae: Aedini)

John F. Reinert

Center for Medical, Agricultural and Veterinary Entomology (CMAVE), United States Department of Agriculture, Agricultural Research Service, 1600/1700 SW 23rd Drive, Gainesville, Florida 32608-1067, and collaborator Walter Reed Biosystematics Unit (WRBU), National Museum of Natural History, Smithsonian Institution, Washington, DC. (e-mail: John.Reinert@ars.usda.gov)

Abstract

Species of the mosquito tribe Aedini with illustrations and/or descriptions of the female genitalia are listed and include corresponding literature citations. Approximately 45% of aedine species currently have published partial or complete illustrations and/or descriptions of the female genitalia.

Key words: Diptera, Culicidae, Aedini, species, female genitalia

Introduction

Current and previously published catalogs of the dipteran family Culicidae do not include a citation category for descriptions and illustrations of the female genitalia of included taxa. This void is filled for species in tribe Aedini by the following list. Each species listed is followed by literature citations in which illustrations and/or descriptions are included. Currently approximately 45% of aedine species are partially or completely illustrated and/or described in the published literature. Representatives of most of the generic-level taxa in Aedini were described and illustrated in a series of papers by Reinert (2000f–i, 2001a–d, 2002b–e, 2008a–l, 2009a–d, 2010a–h). Reinert (2010i) included a list of aedine generic-level descriptions of female genitalia. Reinert (2000e) provided detailed techniques for the preparation of slide-mounted female genitalia and a glossary of anatomical terms of these structures. Reinert (2002e) included a key to aedine genera recognized at that time.

Numerous characters of the female genitalia have proven to be of value in distinguishing species and generic-level taxa of tribe Aedini (see Reinert 2002e, Reinert *et al.* 2004, 2006, 2008, 2009). Unfortunately, within Culicidae many descriptions, at all taxonomic levels, have not included characteristics or illustrations of the female genitalia. These structures are best known in Culicidae for species of tribe Aedini, as exemplified by genera *Heizmannia* Ludlow, *Stegomyia* Theobald and *Verrallina* Theobald.

The following list includes those aedine species with female genitalia partially or completely illustrated (denoted by 1) and/or described (denoted by 2) in parentheses following each literature citation. A question mark (?) following the number 1 or 2 indicates the identification of the species was uncertain. A few species of uncertain generic placement (see Reinert *et al.* 2009)

have the genera and subgenera enclosed within single quotation marks, e.g. ‘*Oc. (Finlaya)*’, indicating usage of their previous generic-level names. Illustrations of the female abdomen with only the cerci protruding and without other genital characters, or with only the cerci described, are not included in the list. Illustrations/descriptions of species as synonyms are included with currently valid species. The new classification of valid generic-level taxa in tribe Aedini proposed by Reinert *et al.* (2009) is utilized. Abbreviations of genera follow Reinert (2009f).

Aedine species with illustrations and/or descriptions of their female genitalia
